A short summary what I have understood from the given resources.

PYTHON

1. What is Backend development?

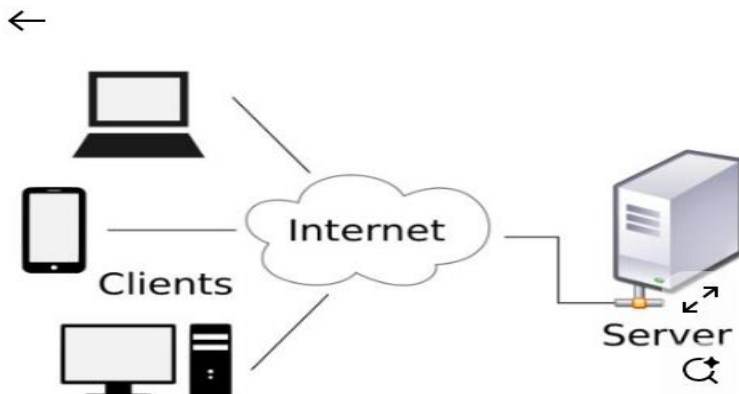

It refers to building the server side logic of a web app. While the frontend is everything that users see and interact with like buttons, text and styles.

2. Client server communication and API

Client is the user facing app ex. web browser , mobile app and desktop app

Server is a remote computer running software that

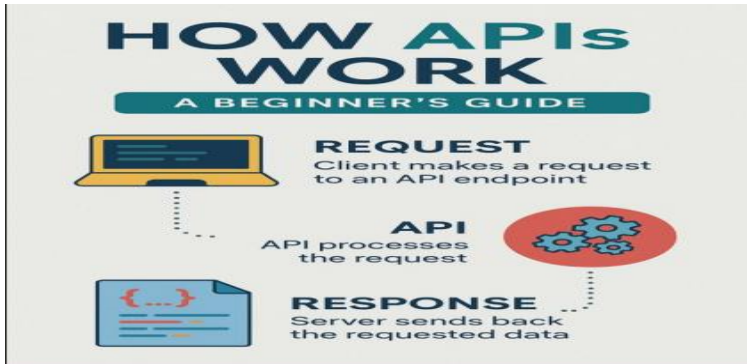

- Receives
- Requests
- Process and
- Sends back response

3. API(Application Programming Interface)

Is a software messenger that allows two different apps to talk to each other. also API is a set of rules that allows different software applications to communicate and exchange data with each other and delivers your request

4. How API works

API works in python by sending structured requests to server by the internet and handling the servers response

5. HTTP(Hyper Text Transfer Protocol)

Is a protocol which you found it whenever you visit a website or send data to an API.

Example whenever you visit a website you will get a URL like this:-

<https://www.youtube.com/watch?v=xlgPMguqyws>

HTTP has four methods these are :-

- **GET** It means that retrieve or read data only
- **POST** meaning that send data to be processed
- **PUT** means updating existing data
- **DELATE** means remove data

6. JSON data

JSON stands for JavaScript object notation. it is the standard format for transferring data in modern API. it is a light weighed and human readable. JSON indicates directly to dictionaries and lists.

7. What is flask and how does routine works

Flask is a python web framework and it is often called a micro framework. It is used to build web applications and also application programming interfaces. It acts as a backend engine.

8. Request and Response

In python programming request and response means that the communication cycle between your code and the external server. The request refers to the message that your code sends to ask for data and perform an action, while a response is the data or status sent back to you by the server.

9. Routing in Flask

Routing in flask is the process of mapping web URLs to specific python functions. This includes the `@app.route()`

@app.route() is a decorator used in flask documentation framework to link a specific web address (URL) to a python function.
